6@ Configure web server and DNS server

Configure server as DHCP server

services → HTTP check if both are on
click on PC0 → Desktop → web server → server address

Trying to map DNS with server

server → DNS → DNS ON → Under name give website address → under address IP address at server

Purpose of DNS - map domain name with server address

- Go to PC0 web server → give IP address we are able to config an DNS server as well as a web server
- All domain names have unique IP address but it is difficult to remember IP address and hence we have a name which makes it easy to browse that web page on browser.
- All domain name is mapped in the back with unique IP address.
- Didn't how to continue DNS services from web
